

InsightAI Executive Report

Based on the analysis of 23 records, the data presents a robust 82% health index. We recommend a regression model targeting 'performance_score' using the available 4 numeric features. Immediate opportunity exists to clean remaining minor flaws and pilot a baseline model to drive measurable business KPIs.

Dataset Overview

Dataset contains 23 rows and 7 columns. 4 numeric fields, 2 categorical fields, and 1 datetime-like fields identified.

Health Score

82

Key Findings

- The dataset features 23 rows across 7 columns with 82% health score.
- Model target candidates include performance_score.

Business Opportunities

- Leverage the 4 numerical indicators to design predictive KPIs.
- Examine high-cardinality categorical attributes for customer behavioral segmentation.
- Automate decision-making loops around target 'performance_score' forecasting.

Risk Factors

- Missing values detected in 5 columns, leading to possible training biases.
- Anomalous values or outliers in 1 numerical columns could distort predictions.
- Framing as regression requires valid stakeholder alignment on performance threshold.

ML Strategy

Primary path: regression workflow with Linear Regression as leading candidate.
